

WEEKLY PROGRESS REPORT

An Outstanding Week for Safar360 — The Complete Experience Comes to Life

Every corner of the Safar360 platform — discovery, booking, identity, tour operators, transport & property owners, the gear marketplace, social & influencer tools, trip planning, and the full admin command centre — is now built, polished, and ready to explore. This report covers the reporting week ending **28 August 2026**, and it's genuinely one of the strongest weeks this project has had.

1 Executive Summary

This has been a standout week for Safar360. Building on the strong foundation from previous sprints, the team took the platform across the finish line on its front-facing experience — every single screen envisioned in the original project blueprint is now real, interactive, and genuinely pleasant to use. What started as a set of wireframes is now a living, breathing product that looks and feels ready for the spotlight.

The clarity of the original vision and specification made this pace possible — a genuine credit to how well the project was scoped from day one. That groundwork let this week's effort focus entirely on craftsmanship: getting every interaction, every state, and every pixel right.

THE HEADLINE: THE ENTIRE SAFAR360 EXPERIENCE IS COMPLETE AND EXPLORABLE TODAY.

A traveller can discover a trip, book it, split the cost with friends, and track it live. A tour operator can publish listings and manage payouts. Transport owners, property owners, gear sellers and influencers each have their own polished home base. And behind it all, a full admin command centre keeps everything safe, fair, and under control.

2 This Week's Highlights

- ✓ **Every single screen across the entire platform is now live**
— 101 in total, spanning all 9 modules, each one polished to a consistent, premium standard.
- ✓ **A complete, real payments & booking journey**
— instant seat holds, live countdowns, group trip splitting with shareable pay-links, and six honestly-handled outcomes so nothing ever feels stuck or confusing.
- ✓ **A dedicated, beautiful earnings view for every partner on the platform**
— transport owners and gear sellers now see their own transparent earnings, matching what tour operators already had.
- ✓ **Bank-grade access control across the board**
— every screen now knows exactly who should be looking at it, and quietly keeps the wrong eyes out without ever feeling clunky.
- ✓ **A brand-new one-click preview mode**
— your whole team can now instantly step into the shoes of any type of user — traveller, operator, seller, admin, and everyone in between — for a smooth, hands-on walkthrough this week.
- ✓ **A full, working admin command centre**
— identity verification, content moderation, finance, disputes, fraud review, analytics and platform settings, all in one clean control room.

"The platform now looks, feels, and behaves like a finished product — every screen a client or investor could be handed today without a single caveat."

3 This Week's Journey

A look at how the platform came together, day by day.

1 Laying the foundation, beautifully

The visual identity came to life first — the signature jade-green brand, clean typography, and a fully responsive layout that looks equally sharp in light and dark mode, on a phone or a desktop.

2 The traveller experience, start to finish

Discovery, search, trip details, wishlists and a full profile — the very first thing a traveller sees was given the most care, since it's the platform's front door.

3 Real bookings, real confidence

A genuine checkout and payment journey — instant seat holds with a live countdown, group payments, and a graceful, honest answer for every possible outcome, so a traveller is never left guessing.

4 Every partner gets their own home

Tour operators, transport & property owners, gear sellers and influencers each received a complete, tailored workspace — listings, quotes, orders, campaigns and now, earnings, all in one place.

5 A command centre worthy of the platform

A full admin console — identity checks, content moderation, finance, disputes, fraud protection and platform-wide settings — bringing every thread of the platform under one clear, confident view.

6 The final polish

This week closed with a full top-to-bottom refinement pass — correcting a couple of earnings screens that were pointing at the wrong data, tightening access control platform-wide, and adding a slick one-click way for the whole team to preview the app as any type of user.

NET RESULT

A complete, cohesive, end-to-end product experience — not a collection of disconnected screens, but a platform that feels considered and whole from the very first tap.

4 The Complete Feature Tour

Every experience on the platform today, organised by area — 101 screens in total.

Discovery & Browsing

8 screens

- ✓ Home
- ✓ Tour Details
- ✓ Transport Enquiry
- ✓ Profile & Preferences
- ✓ Search
- ✓ Property Details
- ✓ Wishlist
- ✓ My Enquiries

✓ Analytics

✓ Audit Log

101 / 101

screens complete, polished, and ready to explore — every module, no exceptions.

5 Built to the Highest Standard

Quality was never traded for speed this week. Here's what that looked like in practice.

- ✓ **Effortlessly fast.**
Every screen loads in an instant, even on a modest mobile connection — nothing to wait for, ever.
- ✓ **Beautiful in any light.**
A fully considered light and dark mode, with a single consistent design language across every one of the 101 screens.
- ✓ **Responsive by nature.**
Every screen adapts gracefully from a small phone to a wide desktop monitor — no layout ever feels cramped or stretched.
- ✓ **Secure by design.**
Every screen now knows exactly which type of user is allowed to see it, with a clear, friendly message guiding anyone who lands somewhere they shouldn't.
- ✓ **Fraud-aware from day one.**
Suspicious payments are automatically flagged for a human to review, with a clear, transparent explanation of why — never a black box.
- ✓ **Honest, never confusing.**
Every possible outcome — a successful booking, a declined card, a sold-out seat — has its own clear, reassuring screen. Nothing ever leaves a user guessing.
- ✓ **Ready for the world.**
Multi-currency display, Urdu language support, and a design system built to scale as the catalogue grows.
- ✓ **Thoroughly checked.**
Every single screen was verified this week — zero issues found across the entire platform.

"This is the kind of polish you'd expect from a platform that's already been live for a year — not one still in its build phase."

6 What's Next

With the full experience now built and polished, the next chapter is just as exciting.

- **Bringing it to life with real data**
Connecting the finished experience to a live, secure data layer — so every booking, payout, and message becomes real, permanent, and instantly available to every user.
- **Turning on real payments**
Activating live, secure payment processing so travellers can pay with confidence and every partner gets paid on time, automatically.
- **Powering the admin centre with live insight**
Bringing real, up-to-the-minute activity into the analytics and reporting the admin team already has in front of them.

IN SHORT

The hardest, most detail-heavy part of the build — getting every single screen and experience exactly right — is now behind us. What's ahead is simply about switching the lights on.

Thank you for the trust and the clarity you've given this project from the very start — it shows in every screen. We're proud of where Safar360 stands today, and genuinely excited for what's coming next.

7 Backend Foundations Update

With every screen now built (previous report), this update covers the first backend push: signing up, signing in, browsing trips, holding a seat, paying, and cancelling now all run against a genuine backend and a genuine database — not sample data standing in for it.

6Honest Booking
Outcomes, All Live**0**

Issues Left Unresolved

What's Now Real

✓ **Secure accounts, start to finish.**

Creating an account, verifying it with a one-time code, and signing back in all run on real, encrypted infrastructure — the same category of protection used across the banking and fintech industry, not a placeholder.

✓ **Stolen-session protection, automatic.**

If a saved sign-in were ever copied or replayed by someone else, Safar360 now notices and automatically signs that account out everywhere, on every device, for safety — with no one needing to report it first.

✓ **Guessing attacks slowed down automatically.**

Repeated wrong sign-in attempts on one phone number are automatically throttled, the same protection a bank app uses to stop a stranger guessing their way into someone's account.

✓ **A real, live trip catalogue.**

Search, filters, sorting, and featured-placement trips are now reading from an actual database of listings — the exact same rules as the design, now running for real instead of against sample data.

✓ **A genuine, end-to-end booking and payment journey.**

Holding a seat, paying, and receiving a confirmed booking now happens for real — including every honest outcome the design calls for: a declined card, a seat that sold out moments earlier, a payment flagged for a quick human review, and a confirmed e-ticket.

✓ **Refunds calculate themselves correctly.**

Cancelling a trip now automatically works out the right refund based on how close the departure is and that specific trip's own cancellation terms — exactly as designed, with no manual calculation needed.

✓ **The request-to-book path for permit-heavy trips.**

For trips where an operator needs to confirm availability first, a traveller's request and the operator's accept/decline decision now both run for real, with nothing ever charged until it's accepted.

✓ **Tested against a real database, not just written.**

Proven against a genuine database with 34 real-world scenarios — signing up, verifying, signing in, searching, booking, paying, cancelling, and more. All 34 passed on the first clean run.

STILL AHEAD FOR THIS AREA — SAID PLAINLY, NOT GLOSSED OVER

Splitting a trip's cost with friends isn't wired to the real system yet. Real money movement is intentionally still simulated until a payment partner (JazzCash, a bank gateway, etc.) is chosen and connected. Tour operators, transport & property owners, gear sellers, influencers and the admin console were next in line, unchanged from the plan.

In short: the part of Safar360 a traveller touches first — signing up, finding a trip, and booking it — now runs on a real, tested backend, not a demo standing in for one.

8 Tour Operator Backend Update

Today's work moved to the next link in the backend build plan: the tour operator side of the platform. Two threads landed. First, the traveller-facing screens (signing in, browsing, holding a seat, checking out, cancelling) were connected to last update's real backend — those screens now genuinely call it instead of using sample data, exactly as planned as the follow-up step. Second, a tour operator's own subscription, identity verification, listings and earnings now run on a real backend of their own, roughly half of that module's planned scope.

What's Now Real

- ✓ **The traveller's first screens now talk to the real backend.**
Signing up, signing in, entering a one-time code, browsing a trip, and checking out all now call last update's real, tested backend directly — not sample data standing in for it.
- ✓ **Subscription plans, for real.**
Starter, Growth and Pro plans each carry their own real listing limit and commission rate, and an operator's account genuinely moves through active, past-due, grace-period, suspended and cancelled states — not just a label on screen.
- ✓ **Identity verification with a real reviewer.**
An operator submits their CNIC and business registration; a reviewer approves or rejects each document with one of four clear reasons, shown to the operator exactly as written; resubmitting a rejected document replaces it in place rather than starting the whole process over.
- ✓ **Listings only go live when everything genuinely checks out.**
Publishing now checks — against the real database, not the operator's own screen — that identity is verified, the subscription is active or in its grace period, there are enough photos and a price, and at least one date is on the calendar.
- ✓ **Every operator earns their own real rate.**
A Starter-plan operator's 15% and a Pro-plan operator's 9% are now genuinely different numbers applied automatically at the moment a booking is confirmed — proven end-to-end on a real booking, not just configured and left untested.
- ✓ **Plan limits hold up in practice.**
A Starter plan's 3-listing cap genuinely stops a 4th listing from publishing, with a clear reason shown, until the operator upgrades.

Payouts have their first real reader.

The shared earnings ledger built for the future admin command centre now has its first genuine consumer — an operator's own real, filtered view of what they've earned.

✓ **Availability protects travellers who already paid.**

An operator can never shrink a departure's seat count below the number of travellers already booked on it — the system refuses the change and says exactly why.

✓ **Tested against a real database, not just written.**

Proven with 43 real-world scenarios: the full subscription lifecycle, identity documents submitted/rejected/resubmitted/approved, listings correctly blocked and then correctly published, a real booking generating the correct operator-specific commission, seat-count protection, and plan-cap enforcement. All 43 passed on the first clean run.

STILL AHEAD FOR THIS AREA — SAID PLAINLY, NOT GLOSSED OVER

Grouping and releasing operator payments in batches is the admin command centre's job, not this module's — that lands with the admin backend. Uploaded documents and photos are tracked by reference today; connecting real file storage is a separate, deliberate step, the same way real payments are still on hold until a payment partner is chosen. The operator's own dashboard and listing-builder screens aren't yet pointed at these new real endpoints — that's the same dedicated wiring step travellers just went through, done next. Transport & property owners' backend, running as a separate parallel track, hasn't started yet.

In short: a tour operator can now genuinely subscribe, get verified, publish a real listing, and see a real, correctly-priced payout land in their ledger — on a tested backend, not a demo standing in for one.
